

IV CONGRESSO NAZIONALE DI
**ECOCARDIO
CHIRURGIA**
MILANO 10-12 MARZO 2010

**La tecnica di *Tirone David*:
da una intuizione fisiopatologica la
soluzione chirurgica della insufficienza
aortica a valvola integra**

Daniele Maselli

Dipartimento di Scienze Cardiovascolari

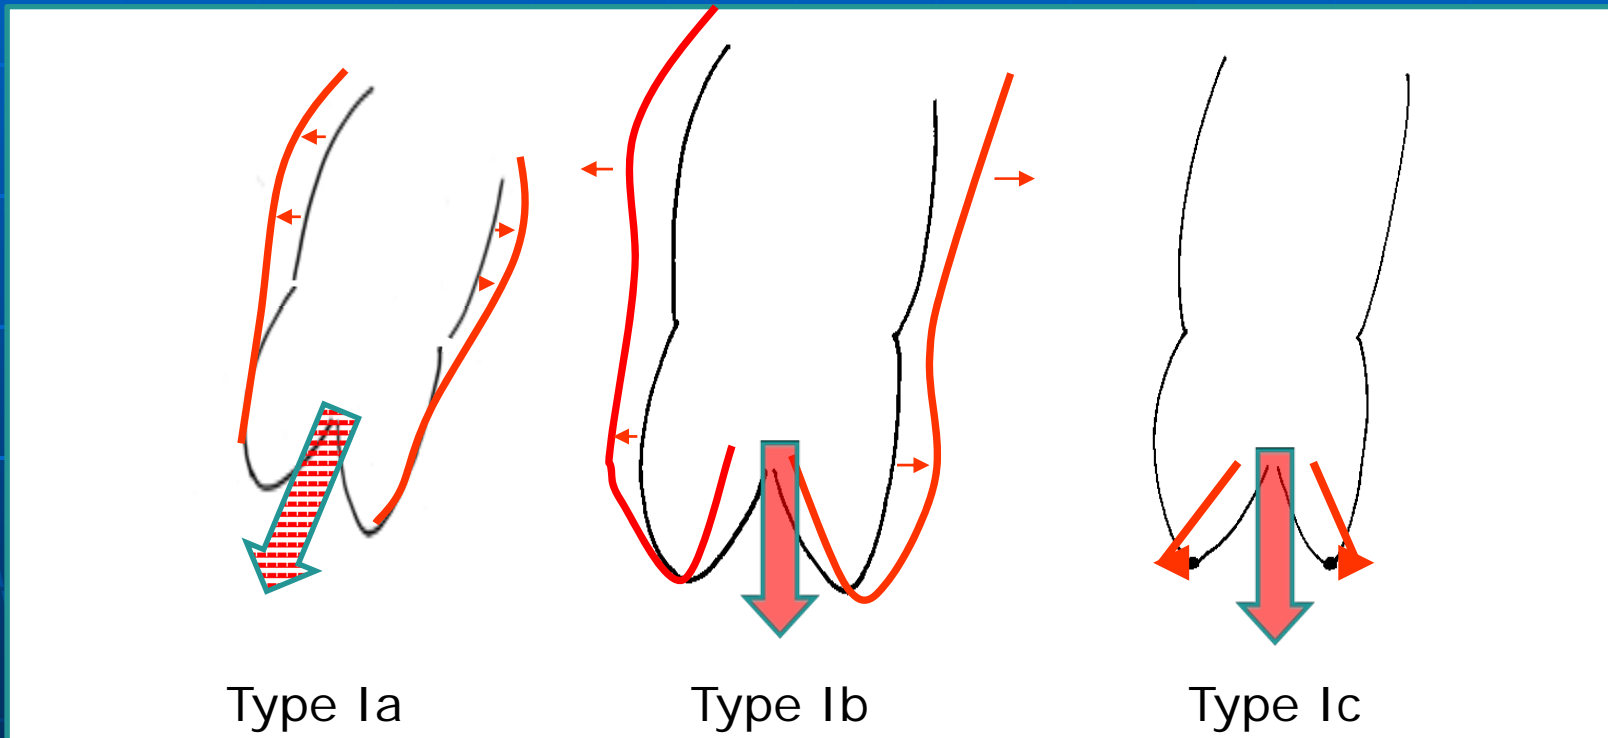

Unità Operativa di Cardiochirurgia

European Hospital Roma

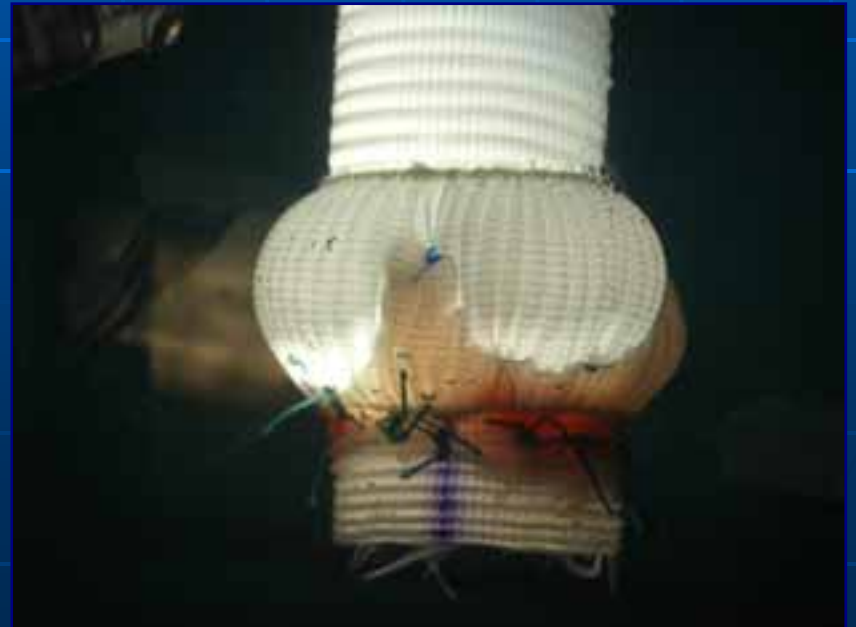

Causes of aortic regurgitation (with normal leaflets)

- FAA pathology (dilatation)

Often valve regurgitation derives from multilesions combined in a variety of associations

The paradoxes of the aortic valve

- ✓ The valve opens before the presence of forward flow
- ✓ Ejection continues even after the aortic pressure exceeds ventricular pressure
- ✓ The aortic valve already starts closing during ejection

The paradoxes of the aortic valve

- ✓ The valve opens before the presence of forward flow
- ✓ Ejection continues even after the aortic pressure exceeds ventricular pressure
- ✓ The aortic valve already starts closing during ejection

Answer:

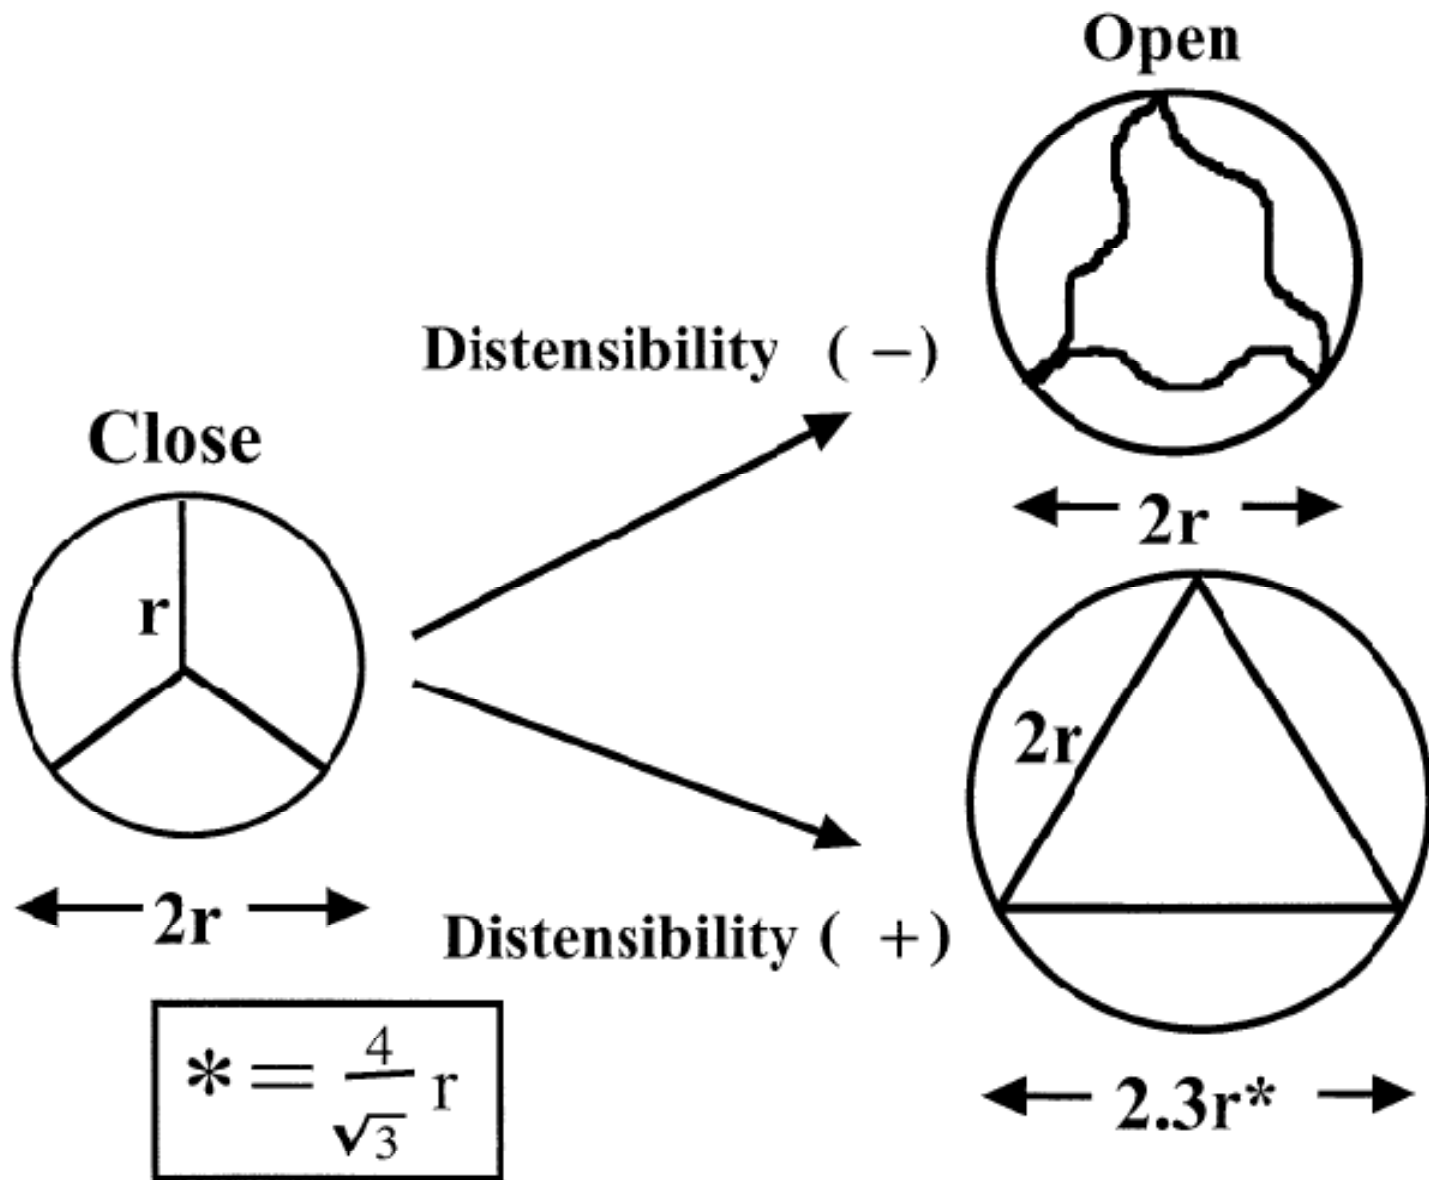

From stellate orifice to small triangle

Increase in ventricular pressure through the interleaflet triangle causes an increase of diameter at the commissures before the valve opens

From small triangle to triangle

Sinuses expansion (increased 16%) to maintain the leaflet distended and flat

The paradoxes of the aortic valve

- ✓ The valve opens before the presence of forward flow
- ✓ Ejection continues even after the aortic pressure exceeds ventricular pressure
- ✓ The aortic valve already starts closing during ejection

Answer:

From triangle to circular orifice

Due to an increase in velocity the blood enter the aorta because of motion's inertia more than pressure gradient"

"Noble phenomenon"

The paradoxes of the aortic valve

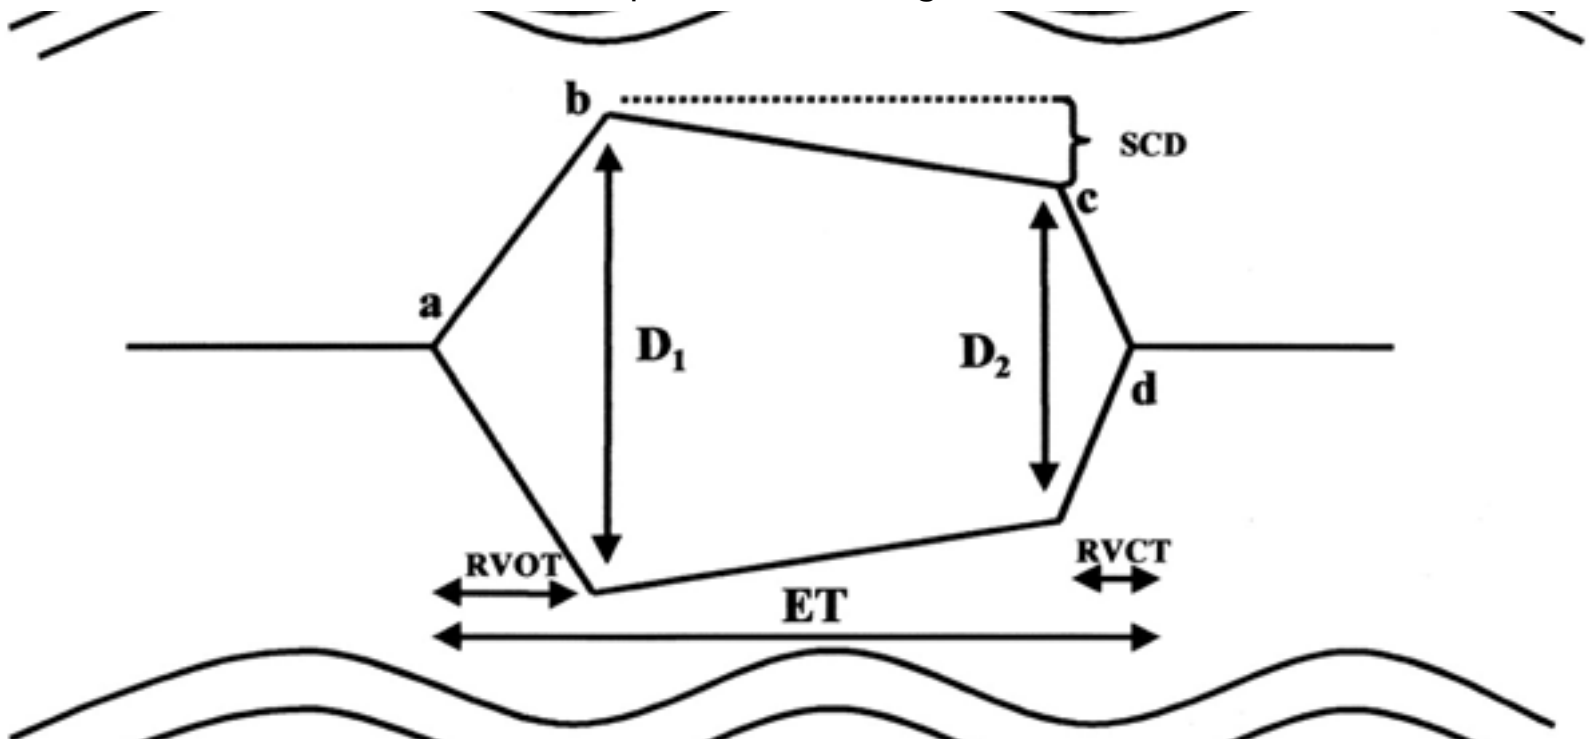

- ✓ The valve opens before the presence of forward flow
- ✓ Ejection continues even after the aortic pressure exceeds ventricular pressure
- ✓ The aortic valve already starts closing during ejection

Mechanism of leaflets closure: the role of the sinuses

Answer:

$a-b$ = rapid valve opening; $b-c$ = slow systolic closure; $c-d$ = rapid valve closing; $RVOT$ = rapid valve opening time; $RVCT$ = rapid valve closing time; ET = ejection time; $D1$ = maximal leaflet displacement; SCD = slow closing displacement; $D2$ = leaflet displacement before rapid valve closing

Schematic drawing of an M-mode tracing describing the measured aortic valve opening and closing features

Old technique “by hand”

Royal Library, Windsor 19117v.

New technique “phase contrast MRI”

Concept of the functional unit sinus-cusp

Shock absorbing
Stress sharing

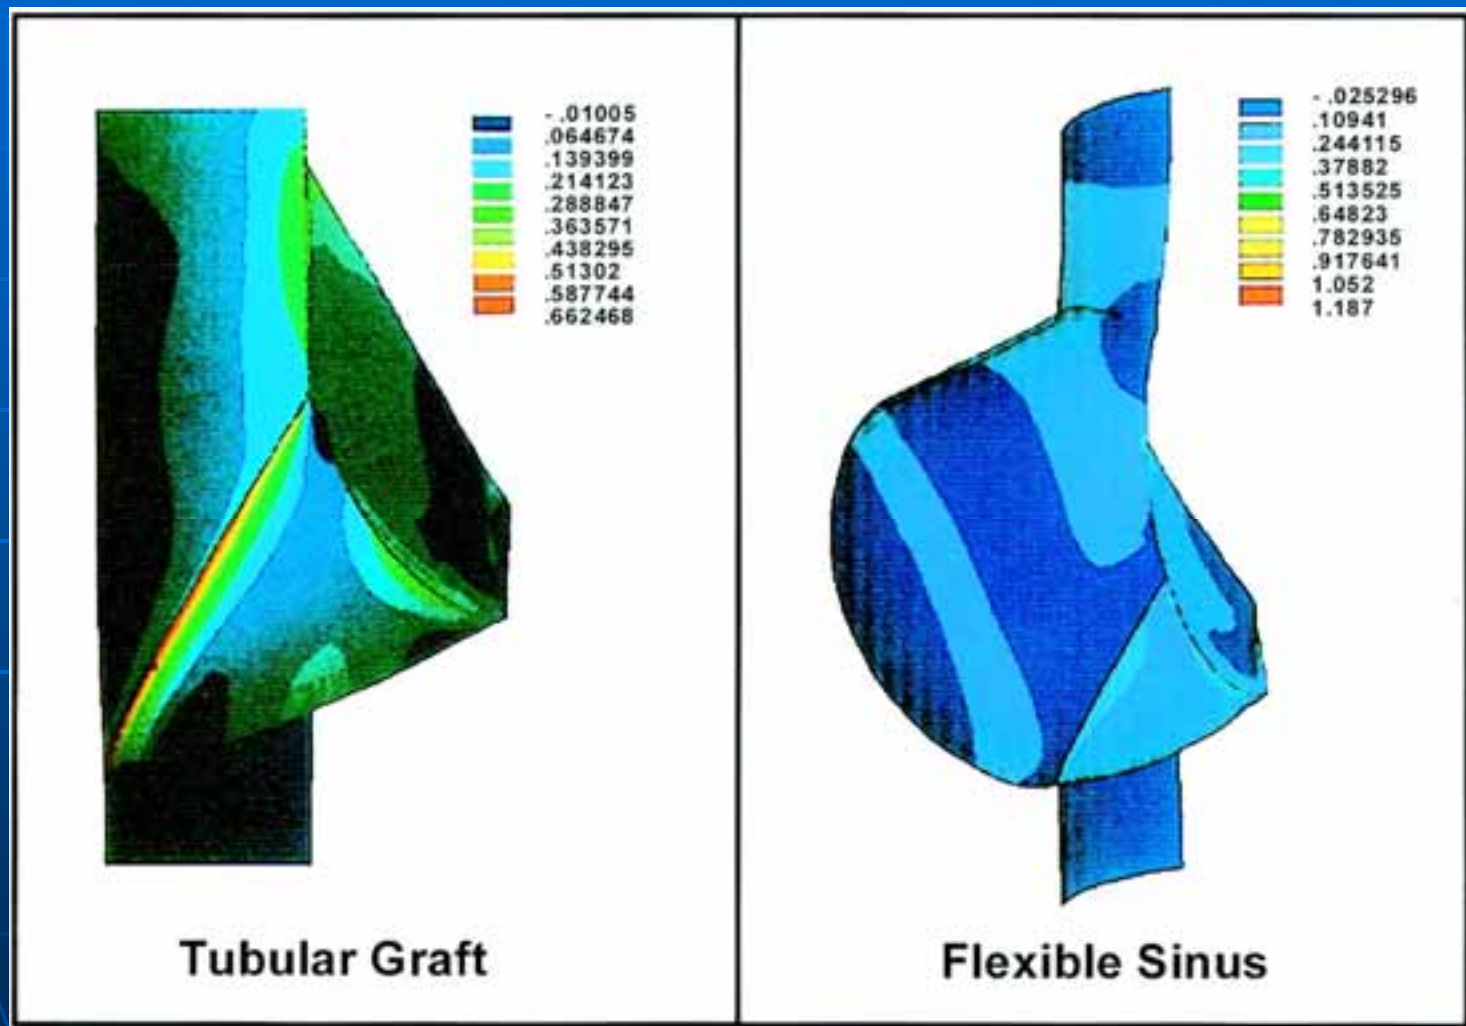

Stress and aortic valve

At 100 mmHg the aortic valve withstand a pressure of:

- ✓ 1,3 Kg vertically
- ✓ 0,6 Kg horizontally (200 g for each commissure)

***Elasticity is an important variable
specially at sinus level***

Stress contours in the aortic root when the flexible sinuses are present versus when the sinuses are absent

Five hundred frames/sec cinematography showing the leaflet surface during valve opening

**Natural
Root**

**Stiffened
Root**

Pathology of the aortic root

with diseased cusps

**Total root replacement
(Bentall procedure)**

with normal cusps

Valve sparing procedure

Valve sparing procedures

1. **Resuspension**
2. **Remodeling (Yacoub 1983)**
 - ✓ Robicsek
 - ✓ Urbanski
 - ✓ The tailor of Gloucester
 - ✓ The Florida sleeve
 - ✓ Hopkins
 - ✓ Lansac
3. **Reimplantation (David 1992)**
 - ✓ Cochran sinus reconstruction
 - ✓ The David's number (I to V)
 - ✓ The Stanford modification (David V)
 - ✓ Gleason
 - ✓ The Valsalva graft
 - Cameron technique*
 - Mazzola modification*
 - Maselli adjustable ST junction*

Normal

Commissures

Sinus

Base

..... minimal diameter
- - - maximal diameter

Leyh RG et al. Circulation 1999;100:2153-2160

REMODELING

Furukawa K et al. Ann Thor Surg 2004;77:1636-41

REIMPLANTATION

The Valsalva graft standardize while combining remodeling and reimplantation

1. Annulus stabilization
2. Support of the aortic wall
3. Less risk of suture bleeding

+

Reconstruction of sinuses of normal shape and dimension

Normal root proportion

ST junction re-established

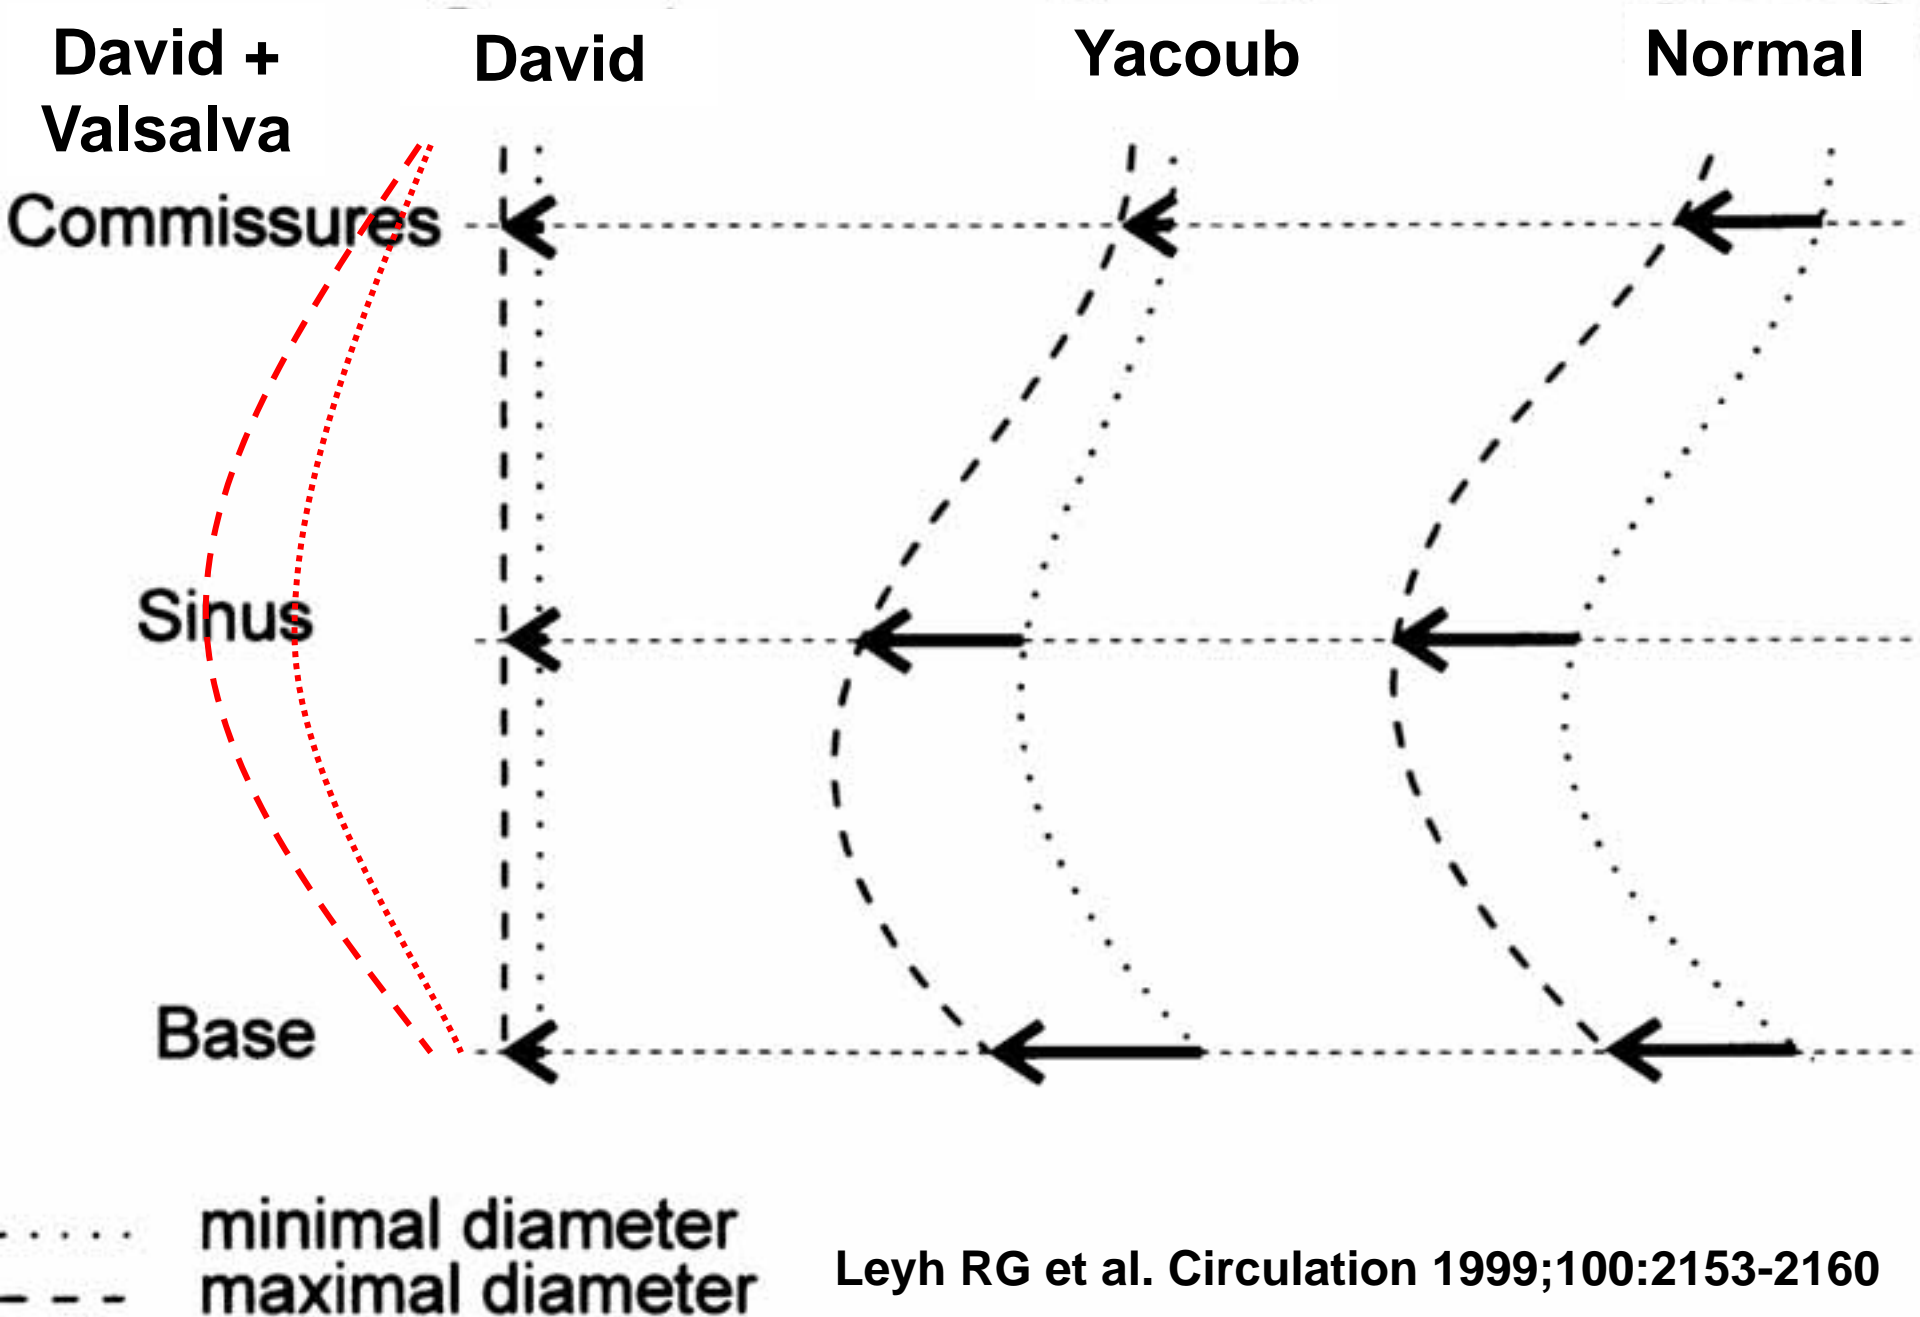

Individual Sinus expansion

Interleaflet triangle

Coaptation height and length

Normal anatomy (nonpressurized)

Echocardiographic anatomy

AORTIC ANNULUS
< ST JUNCTION

*The sinotubular junction is larger than the annulus with a diameter **ratio of 1.3** in a normal adult human heart*

Valsalva sinuses

Aortic annulus

Echocardiographic anatomy

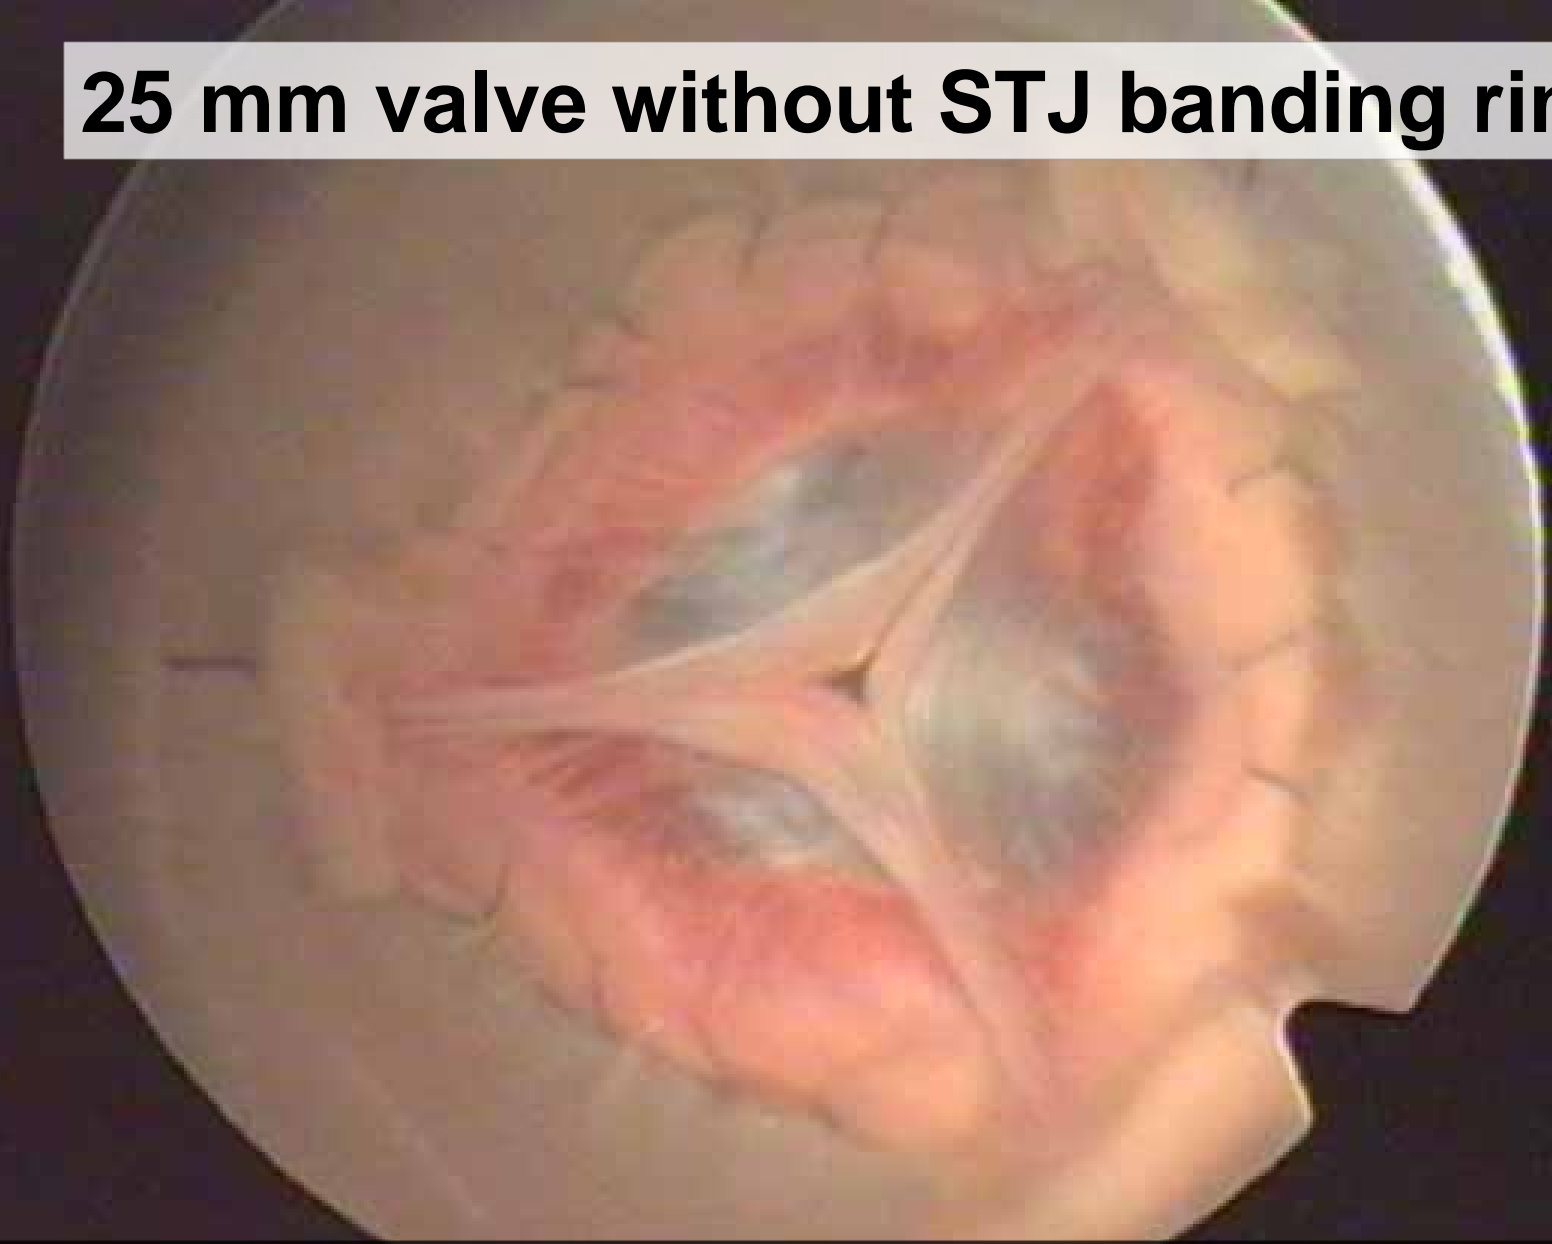

valve size	average leaflet length	average sinus height	average coaptation height
21 (n=4)	21.3 mm (20.6-21.8)	21.4 mm (20.9-22.0)	11.2 mm (10.8-12.6)
22 (n=2)	22.2 mm (21.8-22.5)	22.3 mm (22.1-22.6)	11.7 mm (11.4-12.0)
23 (n=6)	23.4 mm (22.6-24.0)	23.2 mm (22.7-23.8)	12.3 mm (11.6-12.8)
25 (n=2)	25.3 mm (25.2-25.5)	25.1 mm (25.0-25.3)	12.9 mm (12.7-13.1)

25 mm porcine valve sutured into the dilated portion of a 32 mm Valsalva graft

25 mm valve without STJ banding ring

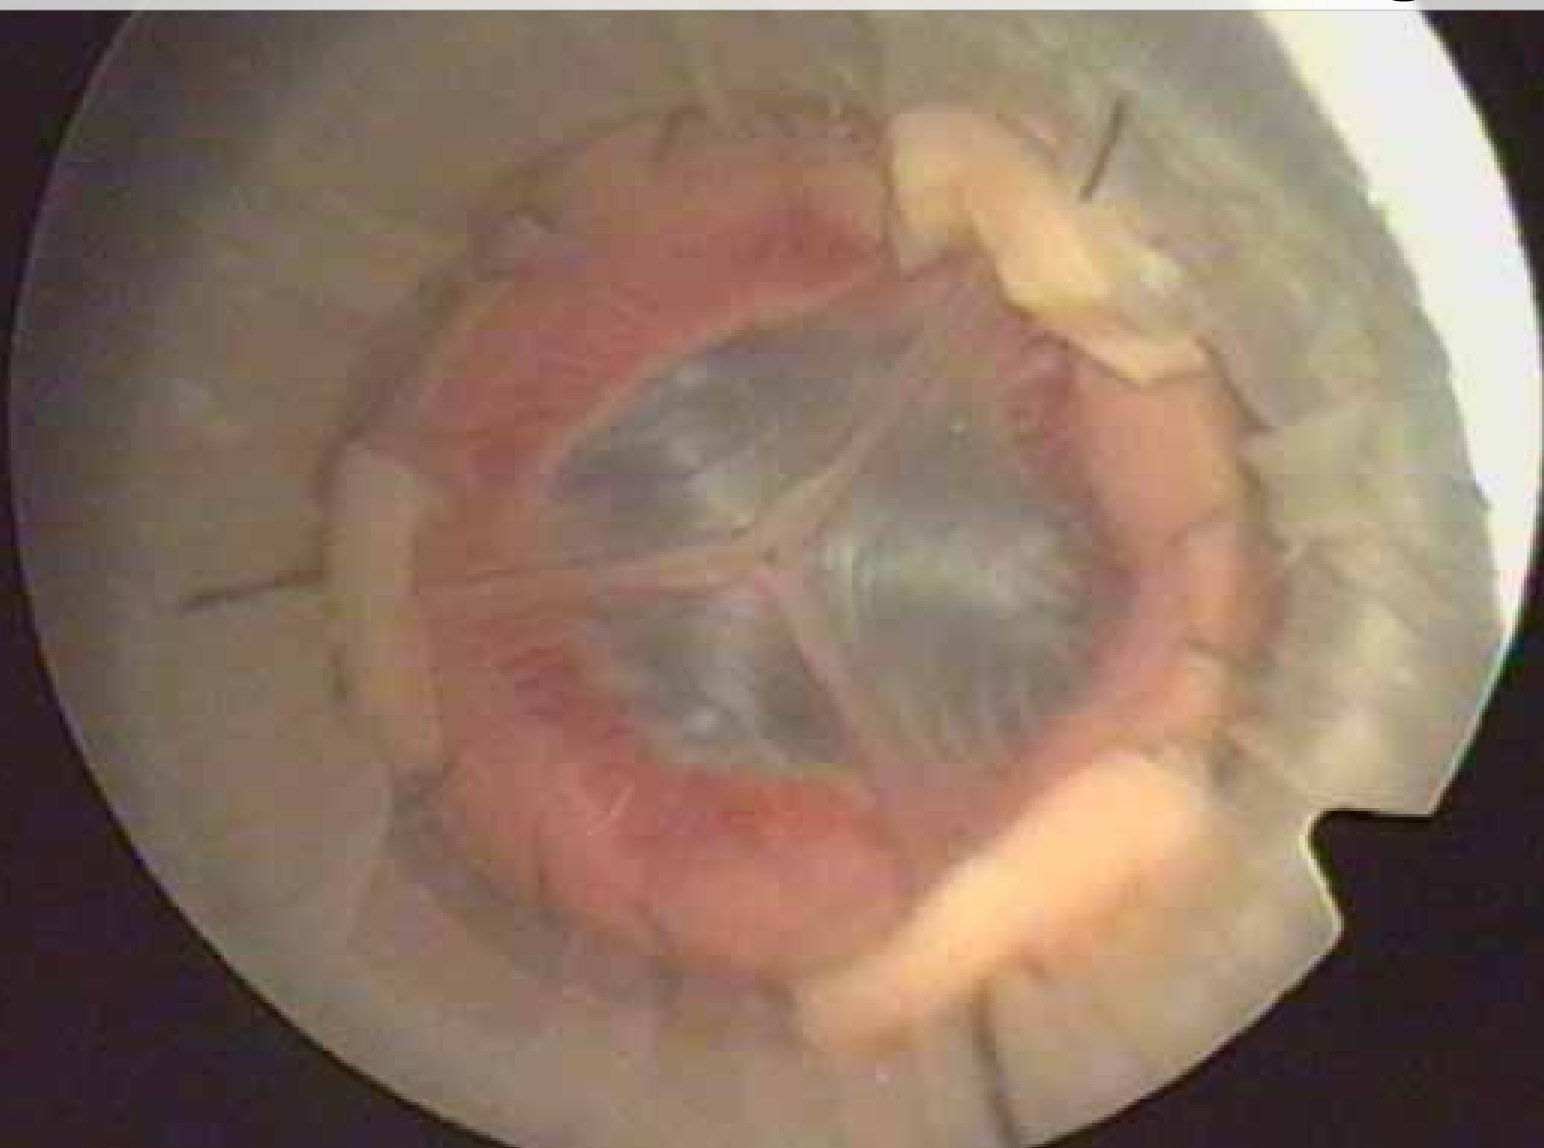

Commissures are displaced centrifugally.
A central orifice is evident. Leaflets tethering and outward bending of the leaflet free margin are evident.

25 mm valve with a 32 mm banding ring

The central orifice is reduced. Leaflets tethering and free margin bending are also reduced but not eliminated.

25 mm valve with a 30 mm banding ring

The central orifice has disappeared.
Leaflets coaptation is optimized.

25 mm valve with a 28 mm STJ banding ring

The central orifice has disappeared.
Leaflets coaptation is optimized but...

Reconstructed leaflet anatomy

	Wrapping Ring Size				p value	p value	p value
	None	32 mm	30 mm	28 mm			
SD (mm)	38.2±0.6	34.1±0.5	33.6±0.5	33.2±0.4			
STJD (mm)	37.6±0.5	30.6±0.5	29.2±0.6	26.9±1			
CH (mm)	7.6±0.6	9.5±0.6	10.6±0.6	7.7±0.4			
CL (mm)	18.6±0.2	18.6±0.5	16.5±0.4	8.2±1.3			

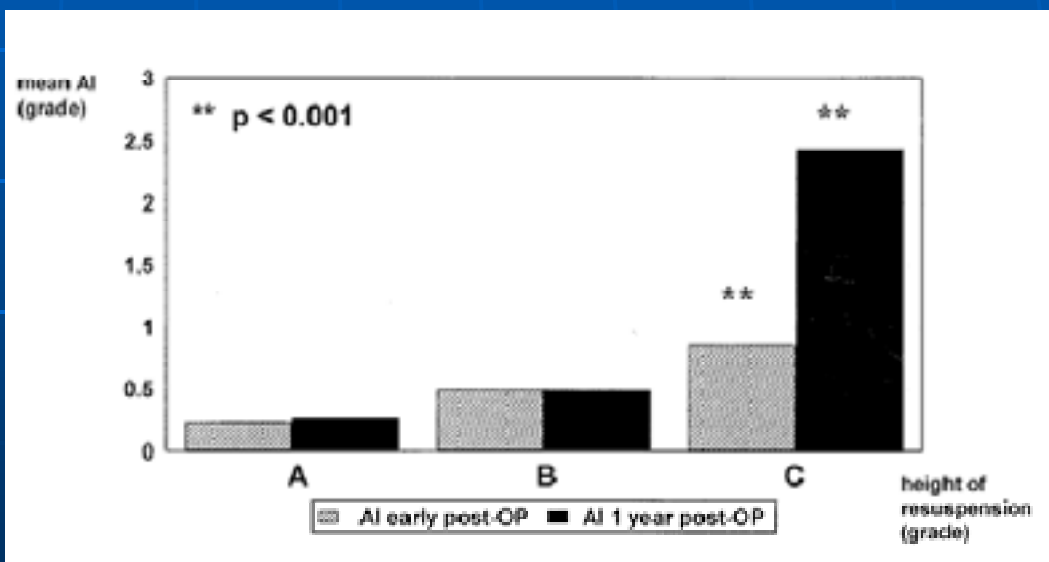

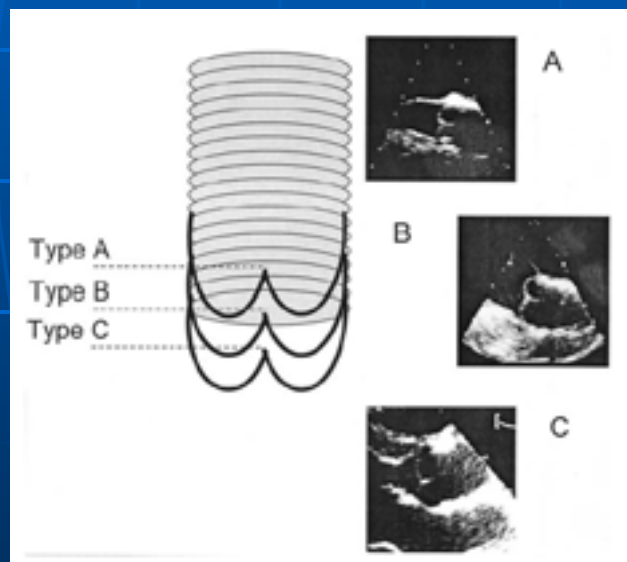

SD = sinuses diameter, STJD = sinotubular junction diameter, CH = coaptation height, CL = coaptation level.

Aortic Valve Reimplantation in Ascending Aortic Aneurysm: Risk Factors for Early Valve Failure

“Anchorache lo ingegno umano faccia inuentioni varie rispondendo con uari strumenti a un medesimo fine mai esso trovera inuentione piu bella ne piu facile ne piu breue della Natura perche nelle sue inuentioni nulla manca e nullo e superfluo”

“Though human ingenuity might make various inventions which by the help of various machines answering the same end will never device any invention more beautiful, nor more simple, nor more to the purpose than nature does; because in her invention nothing is wanting, and nothing is superfluous”
