

## **Cardio-RM. Il paradosso di una metodica di riferimento per la diagnosi di una cardiopatia potenzialmente mortale ma sostanzialmente negata ai cardiologi**

**Santo Dellegrottaglie, MD – PhD**

Laboratorio di RM Cardiovascolare  
Divisione di Cardiologia  
Ospedale Medico-Chirurgico Accreditato Villa dei Fiori  
Acerra (Napoli)

# Variable Clinical Presentation in Adult Patients with Acute or Chronic Myocarditis

Data from the European Study of Epidemiology and Treatment of Cardiac Inflammatory Diseases

True incidence is difficult to determine since clinical presentation varies widely and only 10% of cases leads to clinical symptoms!

# Long-Term Evolution and Prognostic Stratification of Biopsy-Proven Active Myocarditis

Marco Anzini, MD; Marco Merlo, MD; Gastone Sabbadini, MD; Giulia Barbati, PhD;  
Gherardo Finocchiaro, MD; Bruno Pinamonti, MD; Alessandro Salvi, MD;  
Andrea Perkan, MD; Andrea Di Lenarda, MD; Rossana Bussani, MD;  
Jozef Bartunek, MD, PhD; Gianfranco Sinagra, MD, FESC

(*Circulation*. 2013;128:2384-2394.)

N = 82 pts. with EMB-proven acute myocarditis

# Limited Accuracy of the Traditional Diagnostic Approaches to Myocarditis

	Findings
	Sensitivity
Chest pain	30%
ECG abnormalities	50%
Troponin elevation	35-50%
Regional/global LV dysfunction	65%
	global dysfunction
Histological study	Cellular infiltration, Edema, necrosis

## Lab results:

- ↑ Erythrocyte sedimentation rate
- ↑ C-reactive protein
- ↑ Leukocyte count
- ↑ Biomarkers of myocardial injury

The diagnosis of myocarditis is often based merely on suspicion!

# Management of Myocarditis and Lack of an Accurate Diagnostic Modality

- Uncertainty of diagnosis at presentation
- Difficulties in monitoring disease course
- Poor capability of risk stratification
- Weakness of trial design for the evaluation of specific treatment regimens

## Diagnosis of Myocarditis by EMB

## Death of Dallas Criteria

Baughman KL, *Circulation* 2006

- Sampling error (low sensitivity)
- Variation in expert interpretation
- Variance of traditional histopathological findings with other markers of viral infection and immune activation in the heart
- Importance of immunohistological and molecular biological techniques on biventricular samples

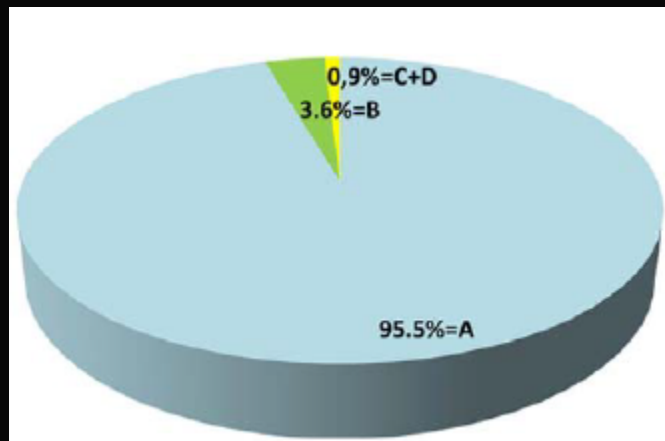

# Contribution and Risks of Left Ventricular Endomyocardial Biopsy in Patients With Cardiomyopathies

## A Retrospective Study Over a 28-Year Period

Cristina Chimenti MD, PhD; Andrea Frustaci MD

Vascular sonography ( <i>n</i> = 3,835,014)	44.8	11.3	23.8	20.0

Levin DC et al. *Am J Roentgenol* 2002

# Cardiac MRI: an Underused Modality

## Radiologist's Faults

- Scarce propensity for collaboration with cardiologists (bad experiences with invasive angio and echo in the past)
- Limited interest in developing strong cardiac MRI services (low revenue)
- On average, inadequate knowledge of CV pathophysiology and capacity to put imaging findings in the right clinical context

## Cardiologist's Faults

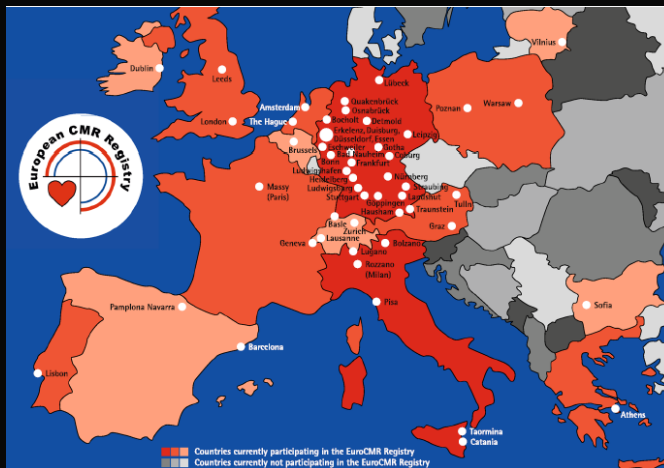

- Cardiac MRI is poorly represented in residency programs (inadequate knowledge of indications and how to use imaging information)
- Self-referral possibility favors other imaging modalities (echo, SPECT)
- No MRI scanners in cardiology departments

# Conclusions

---

- 1- CMR imaging offers a unique combination of safety, feasibility and accuracy in detecting myocarditis**
- 2- CMR-based diagnostic criteria for myocarditis have been recently defined**
- 3- Data from large multicenter trials with standardized protocols comparing CMR studies to biopsy-derived criteria are lacking**
- 4- The prognostic value of CMR criteria for myocarditis begins to be defined**
- 5- Compared with EMB, information about the degree of inflammation, the presence of special forms of myocarditis [e.g., giant cell or eosinophilic myocarditis, which require specific therapies], or the presence and type of virus is not provided**
- 6- Probably, CMR has already become the major diagnostic tool to rule out myocarditis**

DATA ESAME 03/07/2010

N° SEQ. 38-10

SEDE ESPORATA: VSx [] VDx []

#### DESCRIZIONE ISTOLOGICA:

Si osservano tre frammenti di buone dimensioni consistenti in fibre miocardiche normo-orientate ipertrofiche e con evidenza di attenuazione. L'interstizio è aumentato per fibrosi intercellulare, perivascolare, focali aree di sostituzione fibrosa e frequenti infiltrati infiammatori linfomonucleari focalmente associati a necrosi dei cardiociti adiacenti. Nei frammenti in esame sono contenute tre normali arteriole. L'endocardio è moderatamente ispessito con prominenza di fibrocellule muscolari lisce.

#### CONCLUSIONI:

Miocardite con fibrosi e focale evidenza di attivita' in ipertrofia dilatazione ventricolare sinistra.

In considerazione della negativita' della PCR per virus cardiotropi ( vedi referto allegato) puo' essere indicata la terapia immunosoppressiva ( in aggiunta alla terapia di supporto) nel caso di una progressiva e rilevante compromissione della funzione ventricolare sinistra.

# Imaging Myocardial Damage with Cardiac MRI

Normal Myocardium

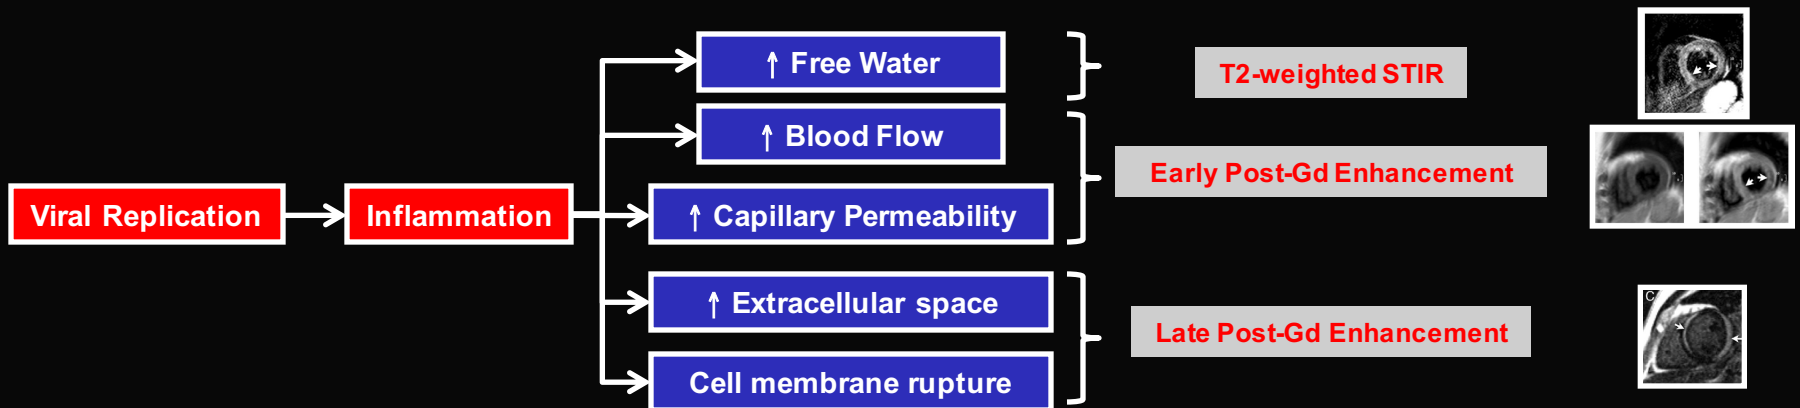

Bound water      Free water

Acutely Damaged Myocardium

Modified from Friedrich M. *Nat Rev Cardiol* 2010

# Differential Diagnosis of Suspected Apical Ballooning Syndrome Using Contrast-Enhanced MRI

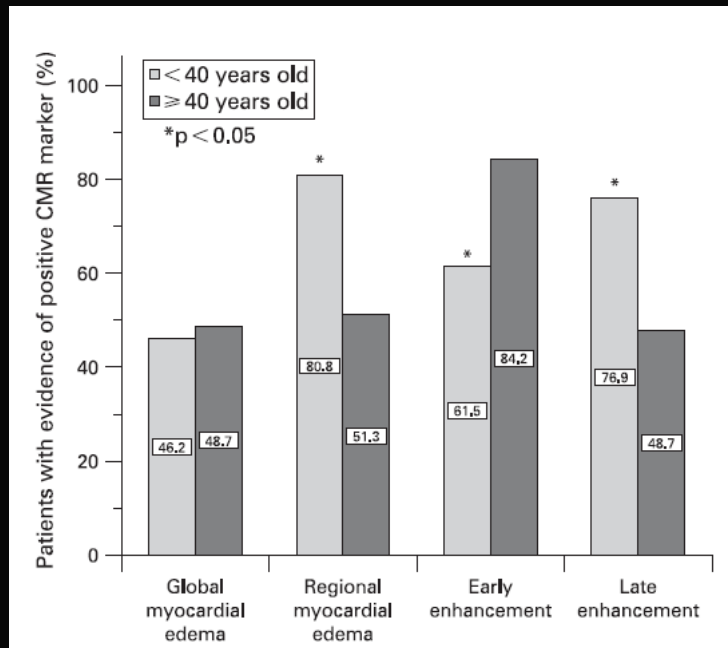

Eitel I. et al. *Eur Heart J* 2008

N= 59 ACS pts with normal coronary vessels and apical ballooning by cath  
(suspected Tako-Tsubo based on Mayo Clinic Criteria)

# Age and Gender Effects on the Extent of Myocardial Involvement in Acute Myocarditis

N= 65 pts with clinically acute myocarditis

# Monitoring Effects of Therapy at the Myocardial Level by Cardiac MR in Patients with Myocarditis

M.L.  
17 year-old female  
Acute viral myocarditis

# EuroCMR Registry

## Results of the German Pilot Phase

Bruder O. et al. *J Am Coll Cardiol* 2009

### Baseline Characteristics N= 11,040 from 20 Centers

All	100 (11,040)
Male	63.7% (7,020/11,017)
Female	36.3% (3,997/11,017)
Age (yrs)	60 (47-70)
BMI (kg/m <sup>2</sup> )	26.2 (23.7-29.4)
Field	
1.0-T	1.1% (116/11,002)
1.5-T	98.2% (10,801)
3.0-T	0.8% (85)
Stress	
No stress	68.5% (7,565/11,040)
Adenosine	20.9% (2,309)
Dobutamine	10.6% (1,166)
Reader	
Cardiologist	78.2% (8,619)
Team of cardiologist and radiologist	20.1% (2,215)
Radiologist	1.7% (187)
<b>Primary indication for CMR</b>	
Myocarditis/cardiomyopathies	31.9% (3,511/11,026)
Suspected CAD/ischemia in known CAD	30.8% (3,399)
Myocardial viability	14.7% (1,626)
Valvular heart disease	4.8% (531)
Aortic disease	3.4% (372)
Congenital heart disease	1.6% (181)
Ventricular thrombus	1.4% (154)
Cardiac masses	1.2% (129)
Pulmonary vessels	1.1% (126)
Coronary vessels	0.2% (25)
Other than above	8.8% (972)

### Impact of CMR on Patient Management by Indication

	Myocarditis/CMP
All (from n = 11,040)	31.8%
Completely new diagnosis not suspected before	21%
Therapeutic consequences	
Change in medication	22.7%
Intervention/surgery	2.9%
Invasive angiography/biopsy	6.3%
Hospital discharge	1.7%
Hospital admission	0.4%
<b>Impact on patient management (new diagnosis and/or therapeutic consequence)</b>	<b>55.0%</b>

From April 2007 and January 2009

# Variable Clinical Presentation in Adult Patients with Acute or Chronic Myocarditis

Data from the European Study of Epidemiology and Treatment of Cardiac Inflammatory Diseases

True incidence is difficult to determine since clinical presentation varies widely and only 10% of cases leads to clinical symptoms!

# Published Controlled Studies on Cardiovascular Magnetic Resonance in Myocarditis

Friedrich M.G. et al. *J Am Coll Cardiol* 2009

	Validation	No. of Patients	No. of Control Patients
Friedrich et al., <i>Circulation</i> 1998 (9)	Clinical	19	18
Laissy et al., <i>Chest</i> 2002 (11)	Clinical	20	7
Rieker et al., <i>Rofo</i> 2002 (36)	Clinical	11	10
Laissy et al., <i>Radiology</i> 2005 (37)*	Clinical	24	31
Abdel-Aty et al., <i>J Am Coll Cardiol</i> 2005 (13)	Clinical	25	22
Mahrholdt et al., <i>Circulation</i> 2006 (40)	Histology	87	26
Gutberlet et al., <i>Radiology</i> 2008 (34)†	Histology	48	35
Yilmaz et al., <i>Heart</i> 2008 (43)†	Histology	55	30
Total		289	179

# CMR Assessment of Human Myocarditis

## A Comparison to Histology and Molecular Pathology

Mahrholdt H et al. *Circulation* 2004

N= 32 pts with clinically-defined myocarditis  
CMR study first and then EMB

# Relationship of Cardiac MR Findings to Clinical Outcome in Patients with Myocarditis

TABLE 7. Predictors of Clinical Outcome: Multiple Linear Model for LVEF at Follow-Up

Variable	Estimate	SE	P	
			Wald	F
(Intercept)	38.51	5.58	<0.0001	
EDV acute	0.48	0.072	<0.0001	<0.0001
Virus				
HHV6+PVB19	-8.14	3.066	0.003	<0.01
Symptom				
Heart failure	-2.78	3.072	0.37	
Other	-10.06	3.89	0.012	
LGE, %LV	-0.751	0.211	0.029	<0.05
LGE septal	-0.56	0.22	0.012	0.012

LGE indicates late gadolinium enhancement. Residual SE=7.925 on 60 *df*. Multiple  $R^2=0.7663$ , adjusted  $R^2=0.7469$ . F statistic: 39.36 on 5 and 60 *df*,  $P=2.2e^{-16}$ .

Late Gadolinium Enhancement

**G. T.**
