

L'ECMO A-V nell'arresto cardiaco refrattario

Maurizio Migliari

m.migliari@asst-monza.it

Supporto avanzato delle funzioni vitali - ALS

DURANTE LA RCP

- Garantire compressioni toraciche di elevata qualità
- Ridurre al minimo le interruzioni
- Somministrare ossigeno
- Utilizzare la capnografia a forma d'onda
- Effettuare compressioni toraciche continue se si sta ventilando attraverso vie aeree avanzate
- Accesso vascolare (via endovenosa o intraossea)
- Somministrare adrenalina ogni 3-5 min
- Somministrare amiodarone dopo 3 shock

TRATTARE LE CAUSE REVERSIBILI

Ipossia	Trombosi – coronarica o polmonare
Ipovolemia	PneumoTorace iperTeso
Ipo-/iperkalemia/Metaboliche	Tamponamento cardiaco
Ipotermia/ipertermia	Tossici

PRENDERE IN CONSIDERAZIONE

- Uso dell'ecografia
- Uso di dispositivi meccanici per compressioni toraciche per facilitare il trasferimento/trattamento del paziente
- Angiografia ed eventuale angioplastica coronarica percutanea
- RCP extracorporea (ERCP)

European Resuscitation Council Guidelines for Resuscitation 2015 Section 3. Adult advanced life support

Jasmeet Soar^{a,*}, Jerry P. Nolan^{b,c}, Bernd W. Böttiger^d, Gavin D. Perkins^{e,f}, Carsten Lott^g, Pierre Carli^h, Tommaso Pellisⁱ, Claudio Sandroni^j, Markus B. Skrifvars^k, Gary B. Smith^l, Kjetil Sunde^{m,n}, Charles D. Deakin^o, on behalf of the Adult advanced life support section Collaborators¹

PRENDERE IN CONSIDERAZIONE

- Uso dell'ecografia
- Uso di dispositivi meccanici per compressioni toraciche per facilitare il trasferimento/trattamento del paziente
- Angiografia ed eventuale angioplastica coronarica percutanea
- RCP extracorporea (ERCP)

Dopo quanto tempo l' ACC è refrattario?

^a Department of Health Science, University of Milano-Bicocca, via Cadore 48, 20048, Monza, MB, Italy

^b Department of Emergency Medicine and Intensive Care, San Gerardo Hospital, via Pergolesi 33, 20900, Monza, MB, Italy

However, both in-hospital CA (IHCA) and out-of-hospital cardiac arrest (OHCA) survival rate continues to be very low. Good functional recovery from CA can be achieved in >75% of patients with return of spontaneous circulation (ROSC) within 15 min from collapse. This is the time window where conventional resuscitative manoeuvres have the highest chance to be effective [15]. For CA times above 15 min, the probability of good functional recovery among all attempted resuscitations falls to around 2%.

Se invece li connetto ad ECMO cosa succede?

- Non esistono studi randomizzati
- Numerosi studi ossevazionali
- Metanalisi

Review article

Extracorporeal resuscitation for refractory out-of-hospital cardiac arrest in adults: A systematic review of international practices and outcomes[☆]

Iván Ortega-Deballon^{a,b,c,d,e,*}, Laura Hornby^{f,g}, Sam D. Shemie^{g,h,i}, Farhan Bhanji^{h,i,j}, Elena Guadagno^k

Outcomes

This systematic review identified a cumulative total of 833 patients in 20 studies. While there was some variability in time points of reported outcomes, the overall reported survival rate was 22%, including 13% having a good neurological recovery (CPC 1–2 or GOS 4–5, see [Table 1](#)). In addition to these short-term results,

Table 2

Commonly cited ECPR inclusion and exclusion criteria and bundle treatments performed.

Inclusion criteria

- Age cutoffs, usually <75 years (low end: 10 years; high end: no upper age)
- Rhythm at the time of CPR (when included, specified as favorable to ventricular arrhythmias or “shockable” rhythms)
- Time interval from collapse to initiation of resuscitation (no flow), generally ≤5 mins (up to <15 mins)
- Witnessed cardiac arrest
- Etiology of arrest, to be of “presumed”, “assumed”, or “suspected” cardiac etiology
- No ROSC despite optimal CPR, usually by 30 mins (as low as 10 mins) – refractory cardiac arrest definition

Exclusion criteria

- Do not resuscitate order
- Severe activities-of-daily-living disability
- Non-cardiac causes of arrest such as severe trauma, uncontrollable bleeding, irreversible brain damage, drug overdose, poisoning, submersion, etc.
- Severe comorbidities (e.g. Often specify as those that would preclude admission to ICU, i.e. terminal illnesses, malignancies, etc.)
- Hypothermia

Bundle treatment options used during ECPR

- Catheter Lab (e.g. PCI, CABG, etc.) ONLY: 2 studies^{23,30}
- Catheter Lab + TTM: 8 studies^{12,21,22,24,25,28,29,31}
- Catheter Lab + IABP: 1 study¹⁷
- Catheter Lab + IABP + TTM: 9 studies^{13–16,18–20,26,27}

CPR, cardiopulmonary resuscitation; PCI, percutaneous coronary intervention; CABG, coronary artery bypass grafting; TTM, targeted temperature management, also known as therapeutic mild hypothermia; IABP, intra-aortic balloon pump.

Review article

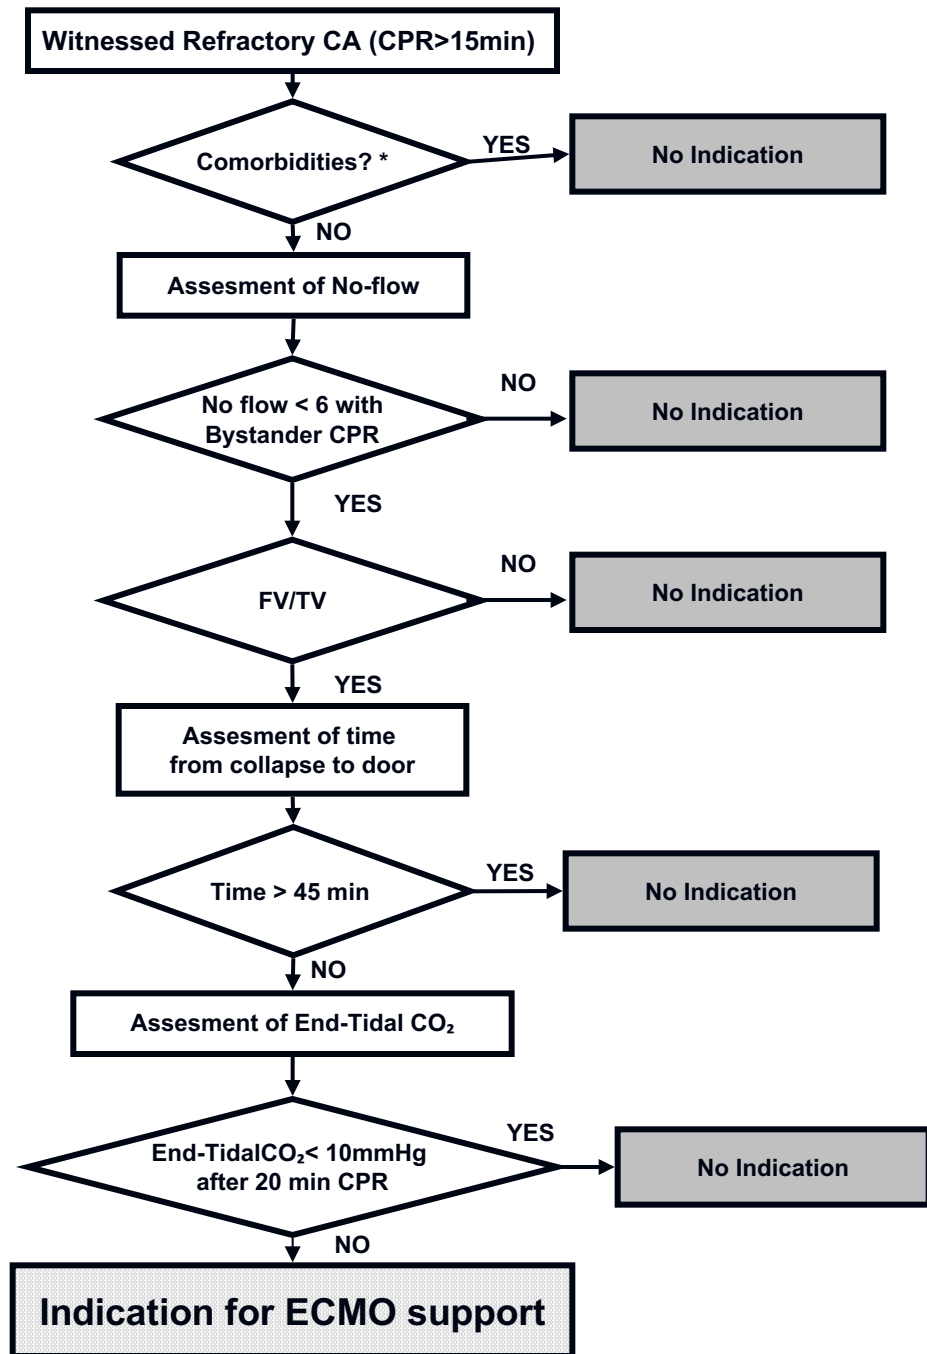

Prognostic factors for extracorporeal cardiopulmonary resuscitation recipients following out-of-hospital refractory cardiac arrest. A systematic review and meta-analysis[☆]

Guillaume Debaty^{a,b,*}, Valentin Babaz^b, Michel Durand^c, Lucie Gaide-Chevronnay^c, Emmanuel Fournel^c, Marc Blancher^b, H el ene Bouvaist^d, Olivier Chavanon^{e,f}, Maxime Maignan^{b,f}, Pierre Bouzat^{c,g}, Pierre Albaladejo^{a,c}, Jos e Labar ere^{a,h}

Conclusion: Observational evidence from published primary studies indicates that shorter low-flow duration, shockable cardiac rhythm, higher arterial pH value and lower serum lactate concentration on hospital admission are associated with better outcomes for ECPR recipients after OHCA.

Selezione del paziente IHCA

Patients with IHCA were eligible for E-CPR at the discretion of the attending critical care physician when it was considered likely that the cardiac arrest would be reversible if veno-arterial ECMO and definitive treatment could be provided immediately. Patients with IHCA were excluded if they were known to have known significant pre-existing neurological disability, non-cardiac co-morbidities that cause limitations in activities of daily living such as severe chronic airways disease, cirrhosis of the liver, renal failure on dialysis and terminal illness due to malignancy.

Extracorporeal Membrane Oxygenation for Refractory Cardiac Arrest

Ann Card Anaesth. 2017 Jan; 20(Suppl 1): S4–S10.

Rationale for Extracorporeal Cardiopulmonary Resuscitation

Survival is low for both in-hospital and out-of-hospital cardiac arrest managed with conventional CPR, on the order of 10% for out-of-hospital and 15%–20% for in-hospital.[\[11,12,13,14,15\]](#) Conventional CPR even when optimally performed provides only a fraction of normal cardiac output, in particular cerebral and myocardial blood

Relation of collapse to CPR and defibrillation to survival: simplified model.
